Name:

Aquatic Food Web: Fish

We are researching: Northern pike

	Habitat: Where do they live?	What do they eat? Or How do they get their energy and nutrients?	Are they producers, consumers, or decomposers? (HINT: Do they fit into more than one of these groups?)
Young	They live in shallow water with vegetation along edges of lakes, rivers, ponds.	Newborns eat zooplankton. When they get older, they eat invertebrates and fish.	Consumers
Adult	They live in cool, shallow water with vegetation along edges of lakes, rivers, ponds until summer. During summer, they move to deeper water that is cooler and has more oxygen.	Adults eat fish, leeches, frogs, crayfish, and larger animals like mice, muskrat, and ducks.	Consumers
